

Presentation Day Run-Sheet

AI Smart Traffic Intelligence Platform | Final

1. Before you leave home

Check	Why it matters
Run <code>python tests/run_all.py</code>	Expect 79 passing. Proves nothing broke overnight
Start the server yourself in your own terminal	A server started by another process can die mid-demo
Open <code>http://localhost:8000</code> and press <code>Ctrl+R</code>	The dashboard is cached hard; a stale page looks broken
Play each demo clip once, end to end	Warms the models and confirms violations appear
Screen-record one perfect run	Your fallback if anything stalls on stage
Charge the laptop and bring the charger	On battery Windows throttles the CPU and analysis halves

2. In the room, before you speak

- Plug into mains power. This is the single biggest performance factor.
- Close Chrome tabs, Teams, OneDrive - they steal the CPU the detector needs.
- Start the first clip **before** you begin talking. The models take about ten seconds to load and that silence looks like a crash.
- Have the screen recording open in a second tab, ready to play.
- Set the dashboard to full screen and check it is readable from the back.

3. Demo order

Roughly six minutes. Spend most of it on the product, not the slides.

Time	Do this	Say this
0:00	Title slide	Six weeks ago we pitched an idea. Today we run it.
0:30	Play <code>sample_1080p.mp4</code>	This is a live feed through the AI. Those numbers are real speed, from surveyed road geometry.
1:30	Click an Over Speeding challan	Photo evidence, speed stamped on the image, plate crop, fine, PDF for the police. No human typ
2:30	Click <code>Send to Police</code>	The full package - challan, evidence photo, plate crop - goes to the traffic mailbox.
3:00	Upload <code>triple_phone.jpg</code>	Two violations from one photograph: no helmet and triple riding.
4:00	Play <code>srilanka.mp4</code>	Watch the counter. It stays at zero - these bikes are parked. Ask any other team what theirs doe
5:00	Vehicles / ANPR tab	Every vehicle logged, plates confirmed by three agreeing reads.
5:30	Close	Safer roads, proven by evidence.

4. Numbers to have ready

Quote these confidently - each is a measured result, not an estimate.

Claim	Figure
Automated tests passing	79 across 7 suites
Speed verified	83-163 km/h on two calibrated cameras
Over-speeding events found	7 on the highway clip, 3 on the second
Vehicles tracked, Sri Lankan road	150, with plates AAG 4002 and BBJ 8752 read
Parked-bike clip	41 vehicles, 0 violations
Replay accuracy	0.99-1.01x true speed
Image analysis	About 2 seconds once models are loaded
Rider detection improvement	yolov8n 12 riders associated, yolov8s 41

5. Questions you will be asked

Question	Answer
How accurate is the speed?	Exact when calibrated. Four surveyed road corners map pixels to metres, then we fit distance against time and
How do you avoid false positives?	Four layers: a confidence floor, a motion gate, multi-frame persistence, and a confidence gate on speed. We
What if the plate is unreadable?	It says UNREADABLE. We never invent a number - a wrong plate on a challan is worse than no challan.
Does it work at night or in rain?	Detection degrades like any camera system. Models are drop-in replaceable, so a night-trained model swap
Why is it not analysing every frame?	It's real-time. On a CPU we analyse about two frames a second and drop the rest, exactly as a live camera
Why did rule X not fire in your demo?	Because the footage does not contain that offence. The system reports only what it can prove. All nine rules
What does deployment cost?	It runs on cameras that already exist. A pilot needs one laptop; a city needs GPU edge boxes. No new came

6. If something goes wrong

Symptom	Do this
Video looks frozen at the start	Normal - models are loading, about ten seconds. Keep talking.
Image upload seems stuck	The first upload loads the models. Wait. Warm runs take two seconds.
Dashboard looks wrong or empty	Press Ctrl+F5. It is almost always a cached page.
Server not responding	Restart it in your terminal, then Ctrl+F5. Meanwhile play the recording.
A violation does not appear	Do not debug on stage. Switch to the recording and continue.
Everything is very slow	Check you are on mains power and close background apps.

7. What to say about the gaps

Do not hide them - lead with them. This is your strongest material, because every other team will claim everything works perfectly.

"All nine rules are implemented and unit-tested. We are demonstrating the ones our footage genuinely contains. We will not stage a violation we did not observe, because fabricated evidence is exactly what this system exists to prevent. During development we found six cases where our own system accused the wrong person - a stopped car fined for a red light belonging to another lane, helmeted riders flagged for no helmet - and we fixed every one. That restraint is the product."

8. Closing line

"Nine violation types, number plates, real speed, automatic challans - one pipeline, running on a laptop, on cameras this country already owns. Safer roads, proven by evidence."
